Orion Equipment Booking Portal

Project proposal

Proposal date: 5 October 2026

Sample 2 fictional demonstration data. Names, dates and events are invented for application testing.

Project goal

The project goal is to build a campus equipment booking portal so students and staff can reserve laboratory equipment and coordinators can approve requests without duplicate bookings.

Scope and user needs

Students and staff will be able to view available equipment, submit booking requests and track approval status. Laboratory coordinators will review requests and approve or reject them. A mobile application and payment collection are outside this release.

Deliverables

Deliverables: an equipment catalogue, a booking request form, a booking API, a coordinator approval queue, a booking history CSV export and a testing report.

Milestones and timeline

Milestones: requirements sign-off on 8 October 2026; catalogue prototype on 12 October 2026; booking API baseline on 14 October 2026; integration testing on 22 October 2026; pilot delivery on 28 October 2026. These are baseline dates, not confirmation that every milestone has been completed.

Responsibilities

Neha owns backend API development. Kiran owns the frontend and booking form. Isha is responsible for integration testing and the testing report. Om owns staging access and inventory import. Dev is responsible for product decisions and requirements approval.

Acceptance criteria

A user must select an equipment item and a start and end time before submitting a request. The portal must reject overlapping approved bookings for the same equipment. A coordinator must be able to approve or reject a pending request. Users must be able to see their request status.

Dependencies and open details

Integration testing requires the booking API and staging access. Inventory import requires an asset inventory export. The maximum booking duration still requires a product decision. The cancellation policy, data retention period and operating budget are not recorded in this proposal.
