

Project Proposal: AI-Driven Enterprise Project Intelligence & Risk Management Platform

Prepared For

Orion Systems Pvt Ltd - Internal PMO Pilot Program. Prepared by the Project Intelligence Engineering Team.

Objective

Build a platform that ingests a project's own documents (proposals, requirements, sprint updates, task lists, risk reports, meeting notes) and uses Retrieval-Augmented Generation to answer questions about project scope, deliverables, risks, blockers and progress, instead of relying on a project manager to manually search through scattered files.

Scope - Milestone 1

Document ingestion for PDF, DOCX, CSV and TXT files; text normalization; chunking; embedding generation; vector indexing with Chroma; and a working retrieval interface that returns the most relevant chunks for a natural-language query, with source and relevance information. Milestone 1 does not include automated risk scoring, forecasting, or a conversational assistant - those are explicitly deferred.

Scope - Future Milestones

Milestone 2 will add automated risk detection, blocker identification and a project health dashboard on top of the Milestone 1 retrieval layer. Milestone 3 will add a conversational project-intelligence assistant and delivery forecasting.

Key Deliverables for Milestone 1

D1: Document ingestion module supporting PDF, DOCX, CSV and TXT. D2: A working RAG pipeline (extraction, normalization, chunking, embedding, indexing, retrieval). D3: A retrieval testing report covering all supported file types and an insufficient-information case. D4: A Streamlit application demonstrating upload, processing and query end to end.

Timeline

The Milestone 1 pilot is planned across 6 two-week sprints. The project is currently in Sprint 3 of 6.
